

# Python in Termux for Hacking – Complete Guide

## ◇ Introduction

Python ek powerful programming language hai jo Termux mein ethical hacking aur penetration testing ke liye sab se zyada use hoti hai. Iski simplicity, extensive libraries, aur community support isko mobile hacking ke liye best banati hain. Termux Android par ek complete Linux environment provide karta hai jahan aap Python scripts aur hacking tools run kar sakte hain bina root ke .

## ◇ Python Setup in Termux

Sab se pehle Termux ke packages update karein. Iske liye `pkg update && pkg upgrade -y` command use karein. Phir Python install karein `pkg install python -y` se.

Installation verify karne ke liye `python --version` run karein. Python packages install karne ke liye pip install karein `pkg install python-pip -y` se.

 **Important Note:** Best compatibility ke liye Termux ka latest version F-Droid se install karna recommended hai. Play Store version outdated hai aur bohot issues create karta hai .

## ◇ Essential Python Libraries for Hacking

**Requests** HTTP requests bhejne, web APIs ke saath kaam karne, aur websites se data fetch karne ke liye use hoti hai. Install karne ke liye `pip install requests` command use karein.

**Scapy** network packets ke saath programming aur experimentation ke liye use hone wali library hai. Packet crafting, sniffing, aur network scanning ke liye best hai. Install karne ke liye `pip install scapy` use karein.

Android/Termux par kuch Scapy features operating system aur permissions ki wajah se limited ho sakte hain, isliye PF15 toolkit use karein jo root ke bina kaam karta hai .

**python-nmap** Python programs ke andar Nmap ko automate karne ke liye use hoti hai. Network scanning, port detection, aur OS fingerprinting ke liye useful hai. Install karne ke liye `pip install python-nmap` use karein.

**Socket** Python ki built-in networking library hai jo low-level network connections, port scanning, aur socket programming ke liye use hoti hai. Iske liye alag se installation ki zarurat nahi hoti.

**Paramiko** SSH connections banane aur remote commands execute karne ke liye use hoti hai. Network devices aur servers par SSH ke zariye automate tasks ke liye helpful hai. Install karne ke liye `pip install paramiko` use karein.

**Colorama** terminal mein colored text output ke liye use hoti hai jo results ko readable aur visually clear banati hai. Install karne ke liye `pip install colorama` use karein.

**Rich** terminal output ko colorful aur readable banane ke liye use hoti hai. Beautiful console output, tables, progress bars,

aur syntax highlighting provide karti hai. Install karne ke liye pip install rich use karein.

#### ◇ Simple Python Scripts – Start Here

**Port Scanner (Beginner):** Basic port scanner jo socket library use karti hai. Yeh script user se target IP leti hai, phir port 20 se 100 tak check karti hai aur jo ports open hain unko display karti hai. Iska code yeh hai:

```
import socket
target = input("Enter target IP: ")
for port in range(20, 100):
    sock = socket.socket(socket.AF_INET,
socket.SOCK_STREAM)
    sock.settimeout(1)
    result = sock.connect_ex((target, port))
    if result == 0:
        print(f"Port {port} is open")
    sock.close()
```

**HTTP Header Viewer:** Yeh script website ke HTTP response headers dekhne ke liye use hoti hai. User se URL leti hai, phir requests library use karke website ke response headers ko print karti hai. Isse pata chalta hai ke website kis technology par chal rahi hai. Iska code yeh hai:

```
import requests
url = input("Enter URL: ")
response = requests.get(url)
print(response.headers)
```

## ◇ Ready-to-Use Python Hacking Frameworks

**BOOGIE** ek all-in-one mobile pentesting toolkit hai jo 47+ modules aur 32+ payloads provide karta hai . Module categories mein reconnaissance (DNS, subdomain brute-force, port scanning), web attacks (SQLi scanner, XSS, LFI/RFI), payload generator (Python, PHP, Bash, Perl, Android APK), phishing kit (Facebook, Google, Instagram), exploitation (privilege escalation checker, SSH/FTP brute-force), aur network attacks (ARP scan, TCP scan, SYN scan, packet capture) shamil hain.

Installation ke liye `pkg update && pkg upgrade -y` karein, phir `pkg install git python -y` se git aur python install karein. Git clone karein `git clone`

<https://github.com/anonymous-beta/Boogie.git>, phir `cd Boogie` aur `python boogie.py` run karein.

**EliteHex** comprehensive penetration testing toolkit hai jo multiple security assessment capabilities ko single interface mein combine karta hai . Features mein network scanning (quick, full, aur vulnerability-focused scans), web exploitation (directory brute-forcing, SQLi, XSS, LFI/RFI, RCE), DDoS attacks (HTTP Flood, TCP SYN Flood, UDP Flood, Slowloris), Shodan recon (vulnerable devices aur services search), auto-exploit CVEs (CVE-2021-41773, CVE-2021-44228 Log4Shell), aur Metasploit integration shamil hain.

Installation ke liye `pkg update && pkg upgrade` karein, phir `pkg install python git nmap curl libxml2 libxslt` se dependencies install karein. Python packages install karein `pip install requests beautifulsoup4`

fake-useragent stem python-nmap shodan colorama  
dnspython se. Git clone karein `git clone`

<https://github.com/BluHEXH/Hex-pentest>, phir `cd`  
`elitehex` aur `python elitehex.py` run karein.

**HunterA** advanced framework hai jo specially Android Termux ke liye designed hai aur no root required hai . Features mein no root required (TCP Connect, PCAPdroid aur Python raw sockets use karta hai), asynchronous engine (high performance ke liye), CVE scanner (product aur banners ke hisaab se vulnerabilities search), OSINT (email/phone/username ke zariye intelligence gathering), sniffing (tcpdump, tshark, PCAPdroid ke through traffic capture), aur Termux:API integration (Wi-Fi scanning, notifications) shamil hain.

**EthicalScan Toolkit** network discovery, port scanning, service detection, aur vulnerability assessment ke liye use hoti hai . Installation ke liye `git clone`

<https://github.com/sarkarsubhadip604-dotcom/EthicalScan-Toolkit.git> karein, phir `cd`

`EthicalScan-Toolkit` aur `pip install -r requirements.txt` se dependencies install karein. Single host scan ke liye `python ethicalscan.py 192.168.1.1` use karein, network discovery ke liye `python ethicalscan.py 192.168.1.0/24 --network` use karein, aur web application scan ke liye `python ethicalscan.py --web`

<http://example.com> use karein.

**PF15** (penetrate-fast\_15) special toolkit hai jo Termux par Scapy ko root ke bina run karne ki facility deta hai . Features mein no-root Scapy patch (kisi bhi Android par kaam karta

hai), Nmap integration (direct network scans), packet crafting (custom TCP/UDP/ICMP/DNS/HTTP packets), aur save to .pcap (Wireshark mein analysis ke liye) shamil hain. Installation ke liye `pkg update && pkg upgrade -y` karein, phir `pkg install python git -y` aur `pkg install nmap -y` se dependencies install karein. Scapy install karein `pip install scapy` se, phir `git clone https://github.com/mikey-7x/pf15-penetration-fast-15.git` karein aur `cd pf15-penetration-fast-15` ke baad `python pf15.py` run karein.

**EvilFeonix Basic** beginners ke liye designed script hai jo commonly used packages aur tools install karti hai . Installation ke liye `apt update && apt upgrade` karein, phir `apt install git` se git install karein. Git clone karein `git clone https://github.com/evilfeonix/EvilFeonix-Basic.git`, phir `cd EvilFeonix-Basic` aur `python3 setup_basic.py` run karein. Installed tools mein core tools (nmap, hydra, curl, wget, git, openssl), extra tools (sqlmap, john, netcat), aur Python packages (requests, scapy, paramiko) shamil hain.

**WebRecon** lightweight reconnaissance framework hai jo Python standard libraries par based hai. Features mein Ping Target, Whois Lookup, Port Scanner, DNS Lookup, GeoIP Tracker, Admin Finder, Subdomain Hunter, WAF Detector, aur Robots.txt Reader shamil hain.

---

### ◇ Python Nmap Commands in Termux

Nmap install karne ke liye `pkg install nmap -y` use karein. Localhost scan ke liye `nmap 127.0.0.1` use karein. Specific port scan ke liye `nmap -p 80 127.0.0.1` use karein. Fast scan (common ports) ke liye `nmap -F 127.0.0.1` use karein. All ports scan ke liye `nmap -p- 127.0.0.1` use karein. Aggressive scan (OS + version + scripts) ke liye `nmap -A 192.168.1.1` use karein. Ping skip + aggressive scan ke liye `nmap -Pn -A 192.168.1.1` use karein.

### ◇ Common Python Package Commands

Package install karne ke liye `pip install package_name` use karein. Package update karne ke liye `pip install --upgrade package_name` use karein. Installed packages dekhne ke liye `pip list` use karein. Package information dekhne ke liye `pip show package_name` use karein. Requirements file se packages install karne ke liye `pip install -r requirements.txt` use karein.

### ◇ Best Practices

Python aur pip ko regularly update rakhein. Sirf trusted repositories se packages install karein. Unknown scripts run karne se pehle unka source aur code verify karein. Projects ke liye requirements file maintain karna achhi practice hai. Tools sirf authorized systems aur legal environments mein use karein .

### Important Note

Yeh notes sirf educational aur learning purposes ke liye hain. Python aur hacking tools ka istemal sirf authorized systems aur legal environments mein karein. Kisi bhi network ya system par bina permission ke testing ya access karna applicable cyber laws ke under punishable ho sakta hai .
