

PYTHON REQUESTS LIBRARY NOTES

Basics of Requests Library with Real Life Examples

Learn Internet Communication in Python

Introduction to Requests Library

Requests library Python ki famous library ha jo internet se data lene aur bhejne ke liye use hoti ha. Ye HTTP requests ko easy banati ha.

Developers websites aur APIs se data access karne ke liye is library ko use karte hain.

Requests beginners ke liye bhi simple hoti ha.

Is library ki madad se web communication possible hoti ha.

Ye GET aur POST jaise methods support karti ha.

Requests library automation projects mein bohat use hoti ha.

Python programmers isay real world applications mein use karte hain.

Ye internet programming ka important concept ha.

Har web developer ko Requests library samajhni chahiye.

Real Life Example: Jaise aap online food order karte ho aur restaurant ko request bhejte ho, waise hi Python website ko request bhejta ha.

Installing Requests Library

Requests library ko use karne se pehle install karna zaroori hota ha.

Python mein pip install requests command use hoti ha.

Pip Python ka package manager hota ha.

Installation ke baad library ko import kiya jata ha.

Import requests likh kar library access hoti ha.

Agar installation na ho to program error de sakta ha.

Requests ki installation bohat simple process ha.

Developers libraries install kar ke naye features add karte hain.

Ye step har beginner ko seekhna chahiye.

Installation programming ka important basic ha.

Real Life Example: Jaise mobile mein app install karte ho tabhi use hoti ha, waise hi Requests library install karni padti ha.

GET Request

GET request ka use website ya API se data lene ke liye hota ha.

Python mein `requests.get()` method use hoti ha.

Ye server ko request bhejti ha aur response return karti ha.

GET request mostly information hasil karne ke liye use hoti ha.

Developers weather aur news data lene ke liye GET use karte hain.

Response mein status code aur content hota ha.

GET request internet communication ka common part ha.

Python is process ko bohat easy bana deta ha.

Beginners ko sabse pehle GET request seekhni chahiye.

Ye web APIs ke liye basic concept ha.

Real Life Example: Google par search karna aur result lena GET request jaisa hota ha.

POST Request

POST request server ko data bhejne ke liye use hoti ha.

Python mein `requests.post()` method use ki jati ha.

Ye forms aur login systems mein use hoti ha.

POST request sensitive data transfer ke liye helpful hoti ha.

Developers APIs ko data send karne ke liye POST use karte hain.

POST request server mein new data add kar sakti ha.

Ye websites ke backend systems mein common hoti ha.

Python POST requests ko simple syntax ke through manage karta ha.

Real world apps mein POST ka use bohat zyada hota ha.

Ye Requests library ka important feature ha.

Real Life Example: Online registration form submit karna POST request ki tarah hota ha.

Status Codes

Status codes server ke responses ko show karte hain.

200 code success ko show karta ha.

404 ka matlab page nahi mila hota ha.

500 server error ko represent karta ha.

Developers status codes dekh kar problems solve karte hain.

Python `response.status_code` se codes access karta ha.

Ye debugging mein bohat helpful hota ha.

Har web developer ko common status codes yaad hone chahiye.

Status codes internet communication ko samajhne mein help karte hain.

Ye Requests library ka basic aur useful topic ha.

Real Life Example: Jaise delivery tracking mein order status dikhaya jata ha, waise hi websites status codes show karti hain.

Working with JSON Data

JSON ek popular data format ha jo APIs mein use hota ha.

Requests library `response.json()` method provide karti ha.

JSON data dictionary ki tarah access hota ha.

Developers APIs se structured data hasil karte hain.

Weather aur social media apps JSON use karte hain.

Python JSON ko easy way mein handle karta ha.

Ye modern web development ka important part ha.

Beginners ko JSON structure samajhna zaroori ha.

JSON readable aur lightweight format hota ha.

Requests library JSON handling ko simple banati ha.

Real Life Example: Mobile apps jo live scores dikhati hain wo JSON data use karti hain.
