

PYTHON FILE HANDLING NOTES

Basics of File Handling with Real Life Examples

Prepared For Learning Python Programming

Introduction to File Handling

File handling ka matlab hota ha files ko create, read, write aur update karna.
Python mein file handling bohat easy aur useful feature ha.
Jab hum kisi data ko permanent save karna chahte hain tab file use hoti ha.
Program band hone ke baad bhi data file mein ■■■■■■ rehta ha.
Python mein text files aur binary files dono handle ki ja sakti hain.
File handling ki madad se hum notes, logs aur records save kar sakte hain.
Ye feature real world software mein bohat use hota ha.
Banks aur schools bhi data files mein store karte hain.
Python simple commands ke through files ko manage karta ha.
File handling programming ka important basic concept ha.

Real Life Example: School ka attendance record ek file mein save kiya jata ha taki baad mein dobara dekha ja sake.

Opening a File

Python mein file open karne ke liye open() function use hota ha.
File open karte waqt file ka naam aur mode diya jata ha.
Modes decide karte hain ke file ko kis purpose ke liye use karna ha.
Agar file exist karti ho to Python usay access kar leta ha.
Agar file na mile to error aa sakta ha.
Open ki hui file ko variable mein store kiya jata ha.
File open karna har file operation ka pehla step hota ha.
Open function programming ko data access karne mein help karta ha.
Har developer ko open() function samajhna bohat zaroori ha.
Ye file handling ki foundation hoti ha.

Real Life Example: Jaise almari khol kar kitab nikalte ho, waise hi Python file open karta ha.

Reading a File

Reading ka matlab file ke andar ka data dekhna hota ha.
Python mein read(), readline() aur readlines() methods use hote hain.
Read() puri file ko ek sath show karta ha.
Readline() sirf ek line read karta ha.
Readlines() sari lines list ki form mein return karta ha.
Reading feature reports aur notes dekhne mein helpful hota ha.
Developers data ko process karne ke liye reading use karte hain.
File reading se stored information ko access kiya jata ha.
Python reading ko bohat simple banata ha.
Ye beginners ke liye easy topic ha.

Real Life Example: WhatsApp chat open kar ke messages parhna bhi reading ki tarah hota ha.

Writing in a File

Writing ka matlab file mein naya data save karna hota ha.
Python mein write() method use ki jati ha.
Agar file exist na kare to Python new file bana deta ha.
Writing mode purana data overwrite bhi kar sakta ha.
Developers reports aur logs save karne ke liye writing use karte hain.
Python easily text ko file mein convert kar deta ha.
File writing automation projects mein bohat useful hoti ha.
Program generated output ko files mein save kiya jata ha.
Write function coding ko practical banata ha.
Ye file handling ka important part ha.

Real Life Example: Diary mein rozana notes likhna file writing ki tarah hota ha.

Closing a File

File ka kaam complete hone ke baad usay close karna zaroori hota ha.
Close() method file ko properly band karta ha.

Agar file close na ki jaye to memory waste ho sakti ha.
System resources ko bachane ke liye close use hota ha.
Python mein with statement automatically file close kar deta ha.
Professional programmers always file close karte hain.
Close karne se errors ke chances kam ho jate hain.
Ye coding ka good practice rule mana jata ha.
File close karna safe programming ko improve karta ha.
Har beginner ko is habit ko follow karna chahiye.

Real Life Example: Kaam ke baad dukaan ka shutter band karna file close karne jaisa ha.
