

ADB App Data Backup and Restore – Complete Notes

◇ ADB Backup – App Data Backup Kaise Karein

adb backup command ka use Android device se kisi specific app ya poori device ka backup lene ke liye kiya jata hai. Backup .ab (Android Backup) format mein save hota hai.

Basic Syntax

```
adb backup [options] -f <backup_file> [package_name]
```

Common Options (Flags)

-f <file> ka use backup file ka naam aur location specify karne ke liye hota hai.

-apk option backup ke saath application ka APK file bhi include karta hai.

-noapk sirf app ka data backup karta hai aur APK ko include nahi karta.

-shared device ki shared storage (SD Card/Internal Storage) ka data bhi backup karta hai.

-noshared shared storage ko backup se exclude karta hai. Ye default option hota hai.

-all device ki sabhi installed applications ka backup leta hai.

-system system applications ko bhi backup mein include karta hai.

-nosystem system apps ko backup se exclude karta hai.

-obb app ki OBB (Expansion) files ko bhi backup karta hai.

-noobb OBB files ko backup mein include nahi karta. Ye default option hai.

◇ **BACKUP EXAMPLES**

Example 1: Specific App ka Data Backup

Sirf ek specific application ka data backup lene ke liye:

```
adb backup -f app_backup.ab com.example.myapp
```

Ye command `com.example.myapp` ka data `app_backup.ab` file mein save karegi.

Example 2: APK + Data Backup

Application ka APK aur uska data dono backup karne ke liye:

```
adb backup -apk -f app_with_apk.ab com.example.myapp
```

Is command se APK aur app data dono backup ho jayenge.

Example 3: APK + Data + Shared Storage Backup

App ke APK, data aur shared storage ka backup lene ke liye:

```
adb backup -apk -shared -f full_app_backup.ab  
com.example.myapp
```

Ye command app ke saath SD Card/Internal Storage ka data bhi backup karegi.

Example 4: Full Device Backup

Puri device ka backup lene ke liye:

```
adb backup -apk -shared -all -f full_backup.ab
```

Ye command sabhi installed applications ke APK, unka data aur shared storage ka backup banayegi.

Example 5: Full Backup with System Apps

Agar system applications ko bhi backup mein include karna ho:

```
adb backup -apk -shared -all -system -f  
full_system_backup.ab
```

Is command se system apps bhi backup ka hissa ban jayengi.

◇ **IMPORTANT NOTES FOR BACKUP**

Backup command chalane ke baad phone par ek confirmation screen aati hai jahan "**Back up my data**" button press karna hota hai.

Backup ko secure banane ke liye encryption password bhi set kiya ja sakta hai. Restore ke waqt wahi password dobara dena zaroori hota hai.

ADB backup .ab (Android Backup) format mein save hota hai jo Android ka proprietary backup format hai.

Kuch secure applications, jaise banking apps, security reasons ki wajah se ADB backup allow nahi karti. Aise apps ka data backup nahi ho pata.

◇ **ADB RESTORE – APP DATA RESTORE KAISE KAREIN**

adb restore command ka use backup file se data ko Android device par wapas restore karne ke liye hota hai.

Basic Syntax

```
adb restore <backup_file>
```

◇ **RESTORE EXAMPLES**

Example 1: Specific App ka Data Restore

```
adb restore app_backup.ab
```

Ye command `app_backup.ab` file se app ka data restore karegi.

Example 2: Full Device Restore

```
adb restore full_backup.ab
```

Ye command poori device ka backup restore karegi.

Example 3: APK + Data Restore

```
adb restore app_with_apk.ab
```

Agar backup mein APK bhi include hai, to application aur uska data dono restore ho jayenge.

◇ **IMPORTANT NOTES FOR RESTORE**

Restore command chalane ke baad phone par **"Restore my data"** screen aati hai. Restore process shuru karne ke liye is button ko press karna hota hai.

Agar backup password-protected hai, to restore ke waqt wahi password enter karna zaroori hai.

Agar backup mein APK include nahi hai, to kuch cases mein application pehle se device par install honi chahiye.

Restore process existing app data ko overwrite kar sakta hai.

◇ **ADVANCED BACKUP METHODS**

ADB Full Backup ka use bina root ke poori device ka backup lene ke liye kiya jata hai.

```
adb backup -apk -shared -all -f backup.ab
```

ADB App Backup bina root ke kisi ek application ka backup lene ke liye use hota hai.

```
adb backup -f app.ab com.example.app
```

Manual Database Pull ke liye aam taur par root access ki zaroorat hoti hai.

```
adb pull /data/data/com.example.app/databases/
```

Manual Copy via ADB Shell mein pehle database ko SD Card par copy kiya jata hai aur phir computer par pull kiya jata hai. Ye tabhi possible hai jab app permissions allow karein.

Python scripts ka use APK, data aur media ka automated backup aur restore karne ke liye kiya ja sakta hai. Root ki requirement script aur app permissions par depend karti hai.

◇ **MANUAL DATABASE BACKUP (LIMITED / NO ROOT)**

Agar application allow karti hai, to database ko SD Card par copy karke computer mein backup liya ja sakta hai.

Database ko SD Card par copy karein:

```
adb shell "cp  
/data/data/com.example.app/databases/notes.db /sdcard/"
```

Computer par database pull karein:

```
adb pull /sdcard/notes.db ./notes.db
```

Restore ke liye database ko dobara device par push karein:

```
adb push ./notes.db /sdcard/notes.db
```

Uske baad file manager (ya root access) ki madad se database ko original location par move kiya ja sakta hai.

◇ **QUICK REFERENCE COMMANDS**

Specific app ka data backup:

```
adb backup -f backup.ab com.example.app
```

APK aur data ka backup:

```
adb backup -apk -f backup.ab com.example.app
```

Puri device ka backup (APK + Data + Shared Storage):

```
adb backup -apk -shared -all -f backup.ab
```

System applications ke saath full backup:

```
adb backup -apk -shared -all -system -f backup.ab
```

Backup file restore karna:

```
adb restore backup.ab
```

Database ya file ko device mein push karna:

```
adb push file.db /sdcard/
```

Device se file computer mein pull karna:

```
adb pull /sdcard/file.db ./
```

◇ **LIMITATIONS AND WARNINGS**

Kuch banking aur secure applications security reasons ki wajah se ADB backup ko support nahi karti.

. ab backup files ko alag Android versions ya different devices par restore karna hamesha successful nahi hota.

Agar backup password ke saath create kiya gaya hai, to restore ke waqt wahi password dena zaroori hota hai. Galat password dene par restore fail ho jayega.

adb backup har application ka complete internal data backup nahi leta. /data/data/ folder ka complete backup lene ke liye aksar root access ki zaroorat padti hai.

⚠ **IMPORTANT NOTE**

Ye notes sirf educational aur learning purposes ke liye hain. Kisi bhi device par bina permission ke access ya data modification karna IT Act 2000 aur anya applicable cyber laws ke under punishable offense ho sakta hai.
