

Termux Mein Network Tools (Nmap aur Netstat) – Complete Guide

◇ Introduction

Termux mein network analysis aur troubleshooting ke liye **Netstat** aur **Nmap** do commonly used tools hain. Inki madad se network connections dekhna, listening ports identify karna aur network information analyze karna aasaan ho jata hai.

◇ **NETSTAT – NETWORK STATISTICS**

netstat command system ki network connections, routing table, interface statistics aur listening ports ki information dikhati hai.

Android Version Limitation

Android 10 aur us se purane versions mein netstat command aam tor par available hoti hai.

Android 10 aur us se naye versions mein ye command har device par available nahi hoti. Agar netstat available na ho to localhost par Nmap scan karke locally open ports ki information dekhi ja sakti hai.

Example:

```
pkg install nmap  
nmap 127.0.0.1
```

◇ **COMMON NETSTAT COMMANDS**

Sabhi Active Connections

System ki active connections aur listening ports dekhne ke liye:

```
netstat -a
```

Sirf TCP Connections

```
netstat -at
```

Ye sirf TCP connections display karta hai.

Sirf UDP Connections

```
netstat -au
```

Ye sirf UDP connections display karta hai.

Listening Ports

Listening ports dekhne ke liye:

```
netstat -l
```

TCP Listening Ports

```
netstat -lt
```

UDP Listening Ports

```
netstat -lu
```

Specific Port Check

Kisi specific port ka status dekhne ke liye:

```
netstat -an | grep 8022
```

Protocol Statistics

Protocol-wise statistics dekhne ke liye:

```
netstat -s
```

TCP Statistics

```
netstat -st
```

PID aur Service Information

```
netstat -tp
```

Routing Table

`netstat -r`

Detailed Network Information

`netstat -antlupe`

◇ **NETSTAT OUTPUT SAMAJHNA**

Netstat output mein aam tor par ye information hoti hai:

Proto – Connection ka protocol (TCP ya UDP)

Recv-Q – Receive queue mein pending data

Send-Q – Send queue mein pending data

Local Address – Local IP address aur port

Foreign Address – Remote IP address aur port

State – Connection ki current state, jaise LISTEN ya ESTABLISHED

◇ **NMAP – NETWORK MAPPER**

Nmap ek open-source network discovery aur analysis tool hai jo network administrators aur developers ko devices aur open services ki information dekhne mein madad karta hai.

◇ **NMAP INSTALL KARNA**

Sabse pehle package update karein.

`pkg update && pkg upgrade -y`

Phir Nmap install karein.

```
pkg install nmap -y
```

◇ **BASIC NMAP COMMANDS**

Localhost Scan

Local device par open ports dekhne ke liye:

```
nmap 127.0.0.1
```

Single Port Scan

```
nmap -p 80 127.0.0.1
```

Port Range Scan

```
nmap -p 1-200 127.0.0.1
```

Fast Scan

```
nmap -F 127.0.0.1
```

All TCP Ports Scan

```
nmap -p- 127.0.0.1
```

Ya

```
nmap -p0-65535 127.0.0.1
```

TCP aur UDP Ports Scan

```
nmap -sU -sT -p0-65535 127.0.0.1
```

Verbose Output

```
nmap -vv -sT -p 1-1023 127.0.0.1
```

Version Detection

```
nmap -A -T4 127.0.0.1
```

Host Discovery Skip

```
nmap -Pn -p 1-9999 127.0.0.1
```

Remote Host Scan

Agar aap apne network ke kisi authorized device ki information dekhna chahte hain:

```
nmap 192.168.1.1
```

◇ **COMMON NMAP OPTIONS**

-sT : TCP Connect Scan

-sU : UDP Scan

-sS : SYN Scan (support platform aur permissions par depend karta hai)

-O : Operating System Detection

- v ya -vv : Verbose Output
- A : Additional detection features
- T4 : Faster Timing
- Pn : Host Discovery Skip

◇ **NETWORK INFORMATION EXAMPLES**

Apna IP Address dekhne ke liye:

```
ip addr show
```

Local subnet ka overview dekhne ke liye:

```
nmap 192.168.1.0/24
```

Specific IP range:

```
nmap 192.168.1.1-254
```

Operating system detection (agar supported ho):

```
nmap -O 192.168.1.1
```

◇ **QUICK COMMAND REFERENCE**

Sabhi network connections:

```
netstat -a
```

TCP connections:

```
netstat -at
```

UDP connections:

```
netstat -au
```

Listening ports:

```
netstat -l
```

Protocol statistics:

```
netstat -s
```

Routing table:

```
netstat -r
```

Localhost scan:

```
nmap 127.0.0.1
```

Single port:

```
nmap -p 80 127.0.0.1
```

Fast scan:

```
nmap -F 127.0.0.1
```

All ports:

```
nmap -p- 127.0.0.1
```

Version detection:

```
nmap -A -T4 127.0.0.1
```

IMPORTANT NOTES

- Android 10 aur us se naye versions mein netstat har device par available nahi hoti.

- Kuch network-related features operating system aur permissions par depend karte hain.
- Nmap aur doosre network analysis tools ka istemal sirf un systems aur networks par karein jinke liye aapke paas authorization ho.

⚠ DISCLAIMER

Ye notes sirf educational aur learning purposes ke liye hain. Network analysis tools ka istemal sirf authorized devices aur networks par karein. Bina permission ke kisi doosre network ya system ko scan karna ya access karne ki koshish karna applicable cyber laws ke under punishable ho sakta hai.
