

Termux Mein Packages Install Karna – Complete Guide

◇ Introduction

Termux mein packages install karne ka sabse common aur recommended tareeqa **pkg** command hai. Yeh **apt** ka wrapper hai jo package management ko beginner-friendly aur easy banata hai.

pkg command automatically package lists ko manage karti hai, installation process ko simplify karti hai aur zarurat padne par repositories aur mirrors ko handle karne mein bhi madad karti hai.

◇ PKG – TERMUX KA DEFAULT PACKAGE MANAGER

Termux internally **APT** aur **DPKG** package management system use karta hai, lekin daily use ke liye **pkg** command recommended hai.

pkg use karne ke faide:

- Package installation ko simple banata hai.
- Commands yaad rakhna aasaan hota hai.
- Repository aur package management ko easy bana deta hai.
- Beginners ke liye sabse suitable package manager hai.

◇ BASIC PACKAGE COMMANDS

Package List Update

Repository ki latest package list update karne ke liye:
`pkg update`

Installed Packages Upgrade

System ke saare installed packages update karne ke liye:
`pkg upgrade -y`

Note: Naya package install karne se pehle hamesha `pkg update` aur `pkg upgrade` run karna achhi practice hai.

Package Install Karna

Single package install karne ke liye:

```
pkg install python  
pkg install git  
pkg install curl
```

Multiple Packages Ek Sath Install Karna

Agar ek se zyada packages install karne hon:
`pkg install python git wget curl -y`

Package Remove Karna

Installed package uninstall karne ke liye:

`pkg uninstall nmap`

Available Package Search Karna

Repository mein package search karne ke liye:

`pkg search python`

Package Information Dekhna

Kisi package ki details dekhne ke liye:

`pkg show python`

Installed Packages Ki List

System mein installed packages dekhne ke liye:

`pkg list-installed`

Available Packages Ki List

Repository ke saare available packages dekhne ke liye:

`pkg list-all`

Package Reinstall Karna

Agar package corrupt ho jaye ya dobara install karna ho:

`pkg reinstall python`

Cache Clean Karna

Downloaded package cache remove karne ke liye:
`pkg clean`

Purani cache files remove karne ke liye:
`pkg autoclean`

◇ **FIRST-TIME TERMUX SETUP**

Agar aap pehli baar Termux use kar rahe hain to sabse pehle system update karein.

```
pkg update && pkg upgrade -y
```

Storage permission enable karein.

```
termux-setup-storage
```

◇ **ESSENTIAL PACKAGES**

Basic development aur Linux environment ke liye commonly use hone wale packages:

```
pkg install wget -y
```

```
pkg install git -y
```

```
pkg install curl -y
```

```
pkg install python -y
```

```
pkg install proot-distro -y
```

```
pkg install openssh -y
```

```
pkg install nano -y
```

```
pkg install vim -y
```

◇ **ADDITIONAL REPOSITORIES**

Agar additional packages ki zarurat ho to extra repositories install ki ja sakti hain.

```
pkg install tur-repo -y
```

```
pkg install x11-repo -y
```

◇ **MANUAL .DEB PACKAGE INSTALL**

Agar kisi compatible .deb package ko manually install karna ho to dpkg command use ki ja sakti hai.

```
dpkg -i package.deb
```

Note: Standard Debian ya Ubuntu ke .deb packages hamesha Termux ke saath compatible nahi hote.

◇ **USEFUL TIPS**

Regular Updates

Termux rolling-release model use karta hai, isliye packages ko regularly update karna recommended hai.

```
pkg update && pkg upgrade
```

Storage Access

Shared storage access ke liye:

```
termux-setup-storage
```

Repository Change Karna

Agar download speed slow ho ya mirror issue aaye:

`termux-change-repo`

Reinstallation

Agar bahut purana Termux install ho aur update errors continuously aa rahe hon to fresh installation aksar behtar option hoti hai.

◇ **MOST COMMON COMMANDS**

Package list update:

`pkg update`

Packages upgrade:

`pkg upgrade`

Package install:

`pkg install <package>`

Package uninstall:

`pkg uninstall <package>`

Package search:

`pkg search <package>`
