

Magisk Modules – Complete Guide

Magisk Modules Kya Hain?

Magisk modules aisi extensions hain jo aapko Android system mein nayi functionality add karne, system components ko modify karne, ya app behavior ko tweak karne ki facility deti hain . Inka sab se bada feature yeh hai ke yeh "systemless" hain, yani yeh core system files ko modify nahi karti balke boot image ko patch karti hain aur ek virtual overlay mount karti hain . Is wajah se OTA updates kaam karte hain aur SafetyNet pass kar sakte hain .

Magisk Modules Kaise Kaam Karte Hain?

Magisk modules /data/adb/modules folder mein store hoti hain. Har module ka ek unique ID hota hai aur uski apni directory hoti hai . Module ki structure kuch is tarah hoti hai :

- **module.prop** – Module ka metadata (id, name, version, author, description)
- **system/** – System partition mein overlay karne ke liye files
- **post-fs-data.sh** – Early boot script (40 seconds timeout)
- **service.sh** – Late boot script (non-blocking)
- **uninstall.sh** – Module remove karne par cleanup script
- **system.prop** – System properties modify karne ke liye
- **sepolicy.rule** – Custom SELinux rules

Modules ko install karne ke liye aap Magisk Manager app mein "Install from Storage" select karte hain aur ZIP file select karte hain .

Magic Mount System

Magic Mount Magisk ka core mechanism hai jo modules ko system files modify karne ki facility deta hai bina actual system partition ko change kiye . Yeh bind mounts aur tmpfs overlays use karta hai .

Zygisk Kya Hai?

Zygisk Magisk framework ka ek feature hai jo developers ko Zygote process mein custom code inject karne ki facility deta hai . Zygote Android ka parent process hai jo applications launch karta hai . Zygisk ke zariye modules app processes mein code run kar sakte hain aur app behavior ko modify kar sakte hain .

Popular Magisk Modules Categories

Performance & Gaming Modules

NovaXFusion performance module hai jo CPU, GPU, aur RAM optimization provide karta hai . Ismein CPU governor tuning, GPU performance tuning, aur automatic optimization features hain . Termux mein `su -c nxm` command se control kiya ja sakta hai .

SpeedCool comprehensive optimization module hai jo CPU aur GPU overheating control, efficient RAM management, aur dynamic system optimization provide karta hai . Yeh MediaTek, Tensor, Kirin, Qualcomm, Exynos sab chipsets par kaam karta hai aur Android 6 se 16 tak support karta hai .

PerfMTK MediaTek devices ke liye specialized module hai jo Mali GPUs ke saath kaam karta hai . Ismein Powersave, Balanced, aur Performance modes hain . Termux mein su -c perfmtk command se control kiya ja sakta hai .

Root Hiding & Detection Avoidance Modules

Shamiko LSPosed team ka module hai jo root status aur system modifications ko apps se chhupata hai . Yeh MagiskHide ke saath mil kar kaam karta hai aur banking apps, games, aur security-sensitive apps mein root detect hone se bachata hai .

Background Specter keybox management, security spoofing, aur detection avoidance provide karta hai .

MagicNet systemless network routing aur transparent tunneling module hai jo system-level connection optimization provide karta hai .

System Customization Modules

LSPosed Irena Zygisk-based ART hooking framework hai jo Xposed module compatibility provide karta hai .

System App Nuker pre-installed bloatware ko remove karne ke liye module hai .

Font Loader system fonts ko safely replace karne ke liye module hai .

Device Faker Zygisk-based module hai jo per-app basis par device properties spoof karta hai .

ADB & Developer Modules

AutoTCP automatically TCP port 5555 open karta hai wireless ADB ke liye .

Auto ADB Enable boot par automatically ADB enable karta hai .

Wireless ADB Module wireless debugging ko manage karne ke liye controller provide karti hai .

Privacy & Security Modules

Clipboard Whitelist malicious apps ko clipboard read karne se rokta hai .

No Proc Stat Restriction CPU usage visibility restore karta hai system monitors ke liye .

Network & DNS Modules

Tailscale Module rooted Android devices par Tailscale networking tool run karne ke liye .

PingPimp network optimization module hai jo TCP/IP stack tweak karta hai aur latency reduce karta hai .

Module Installation Kaise Karein?

1. Magisk Manager app open karein
2. Modules tab par jayein
3. "Install from Storage" button press karein
4. Module ka ZIP file select karein
5. Reboot karein

Important Tips

Systemless Nature: Modules system files ko permanently modify nahi karti, isliye uninstall karna easy hai. Sirf module remove karein aur reboot karein .

Compatibility Check: Har module har device par kaam nahi karti. Install karne se pehle module ki documentation zaroor check karein .

Bootloop Risk: Kuch modules bootloop cause kar sakti hain. Isliye Magisk ke pas recovery mechanism hai — agar

bootloop ho toh custom recovery mein jaakar module delete kar sakte hain .

Module Updates: Magisk Manager app updates check karti hai. Update available ho toh notification aati hai .

Zygisk Enable: Zygisk-based modules ke liye Magisk settings mein Zygisk enable hona chahiye .

 **Important Note:** Yeh guide sirf educational aur learning purposes ke liye hai. Modules ka istemal apne own devices par authorized access ke saath karein. Kisi doosre ke device par bina permission ke modifications karna applicable cyber laws ke under punishable hai.
