DANGEROUS PERMISSIONS EXPLANATION

MADE BY
SYED GHOUS

Cyber Security mein Dangerous Permissions un permissions ko kehte hain jo kisi application ya software ko user ke sensitive data ya device ke important features tak access deti hain. Agar yeh permissions kisi trusted application ko di jayein to woh apna kaam sahi tarah karti hai. Lekin agar koi malicious (nuksan pohanchane wali) application in permissions ka misuse kare, to user ka personal data chori ho sakta hai, device hack ho sakta hai, ya user ki privacy khatam ho sakti hai. Isi liye Cyber Security mein permissions ko bohat important mana jata hai aur har application ko sirf utni hi permissions milni chahiye jitni uske kaam ke liye zaroori hon.

Cyber Security Mein Importance

Cyber Security ke perspective se dangerous permissions bohat important hain kyun ke agar koi malicious ya fake app unnecessary permissions hasil kar le, to wo user ka personal data chura sakti hai, spying kar sakti hai ya financial fraud bhi kar sakti hai. Ethical hackers aur security analysts in permissions ko analyze karte hain taake app ka behavior aur security level check kiya ja sake.

Camera Permission (CAMERA)

Camera permission app ko device ka camera use karne ki ijazat deti hai. Agar koi malicious app is permission ka misuse kare to wo user ki

knowledge ke baghair photos ya videos record kar sakti hai. Spyware applications aksar isi permission ka misuse karti hain.

Microphone Permission (**RECORD_AUDIO**)

Microphone permission app ko audio record karne ki access deti hai. Is permission ka misuse karke attacker user ki private conversations secretly record kar sakta hai. Is wajah se yeh privacy ke liye bohat sensitive permission mani jati hai.

Location Permission (**ACCESS_FINE_LOCATION, ACCESS_COARSE_LOCATION**)

Location permission app ko user ki current location hasil karne ki ijazat deti hai. Agar yeh permission kisi fake app ko mil jaye to wo user ki movement aur live location ko continuously track kar sakti hai, jo privacy ke liye serious risk hai.

Contacts Permission (**READ_CONTACTS, WRITE_CONTACTS**)

Contacts permission se app phone ke contacts ko read ya modify kar sakti hai. Malicious apps is data ko chura kar spam messages, phishing attacks ya social engineering ke liye use kar sakti hain.

SMS Permission (**READ_SMS, SEND_SMS, RECEIVE_SMS**)

SMS permission app ko messages read, send aur receive karne ki access deti hai. Banking Trojans aur malware is permission ka misuse karke OTP codes aur verification messages chura lete hain, jis se online accounts hack ho sakte hain.

Phone Permission (**READ_PHONE_STATE**, **CALL_PHONE**)

Phone permission device ki phone information access karne aur calls karne ki ijazat deti hai. Agar is permission ka misuse ho to attacker unauthorized calls kar sakta hai ya device ki information hasil kar sakta hai.

Protection Tips

- **Sirf Trusted Apps Install Karein:** Apps hamesha official stores se download karein aur unknown sources se bachain.
 - **Permissions Check Karein:** App ko sirf wahi permissions dein jo uske kaam ke liye zaroori hon. Unnecessary permissions deny kar dein.
 - **Permission Manager Use Karein:** Regularly check karein ke kis app ke paas kaunsi permissions hain aur zarurat na hone par unhein revoke kar dein.
 - **Phone Aur Apps Update Rakhein:** Latest updates install karein taake security vulnerabilities fix ho saken.
 - **Google Play Protect Enable Rakhein:** Ye harmful apps ko detect karke user ko warning deta hai.
 - **Least Permission Principle Follow Karein:** Har app ko sirf minimum required permissions dein taake privacy aur security dono protect rahen.
-

PRO TIP: 💡 Hamesha "Least Permission Principle" follow karein — App ko sirf utni hi permissions dein jitni uske kaam ke liye zaroori hon.
