

Python Loops & Conditions: Master Guide

Prepared by: Syed Ghous

1. Conditions (Faisla Lena)

Conditions programming ka wo hissa hain jahan computer "faisla" leta hai [cite: 9]. Agar condition sahi (True) ho toh ek kaam hota hai, aur agar galat (False) ho toh doosra [cite: 9].

```
signal = "Red"
if signal == "Red":
    print("Ruko")
else:
    print("Chalo")
```

Real-life Example: Traffic signal [cite: 9]. Agar Red hai toh ruko, warna chalo [cite: 9].

2. Loops (Kaam ko Duhrana)

Jab hamein ek hi kaam baar-baar karna ho, toh loop ka use karte hain taake mehnat kam ho [cite: 9].

Real-life Example: Teacher ka kehna "Apna naam 10 baar likho" [cite: 9]. Aap tab tak likhte hain jab tak 10 poore nahi ho jate [cite: 9].

3. For Loop (Ginti ke hisaab se)

Jab hamein pehle se pata ho ke kaam kitni baar karna hai, toh 'for' loop best hai [cite: 9].

```
for i in range(5):  
    print("Yeh kaam 5 baar hoga")
```

Real-life Example: Tasbeeh par 100 daane ginn-na [cite: 9].

4. While Loop (Condition puri hone tak)

Ye tab tak chalta hai jab tak uski di gayi condition "True" rehti hai [cite: 9].

```
hungry = True
while hungry == True:
    print("Khana khao")
    hungry = False
```

Real-life Example: Plate mein khana jab tak hai, tab tak khate raho [cite: 9].

5. Loops aur Conditions ka Milap

Jab hum loop ke andar 'if' condition lagate hain, toh hum bohot complex kaam asani se kar sakte hain [cite: 9].

```
numbers = [1, 2, 3, 4, 5]
for n in numbers:
    if n % 2 == 0:
        print(n, "is Even")
```

Real-life Example: Basket mein se fruits nikalna aur sirf "kharab" fruits ko alag karna [cite: 9].
