Only for study – do not try on another phone

## Android vs iOS – What's Possible?

Yeh sabse pehla sawaal hai jo har beginner poochta hai:

Android hack karna easy hai ya iPhone?

Chaliye, is sawaal ka jawab aasan examples ke saath samajhte hain.

### Android – Open Gate (Khula Darwaza)

Android ka system Linux par based hai. Linux ek open-source operating system hai, matlab isme thoda bahut modification kar sakte hain.

### Android mein kya kya ho sakta hai?

Apps install karna:

Aap sirf Play Store se nahi, balki outside Play Store bhi apps install kar sakte hain. Jaise koi bhi APK file internet se download karein aur manually install karein. Ye iPhone mein possible nahi hai.

### USB Debugging:

Android mein aap Developer Options ko on karke USB Debugging enable kar sakte hain. Iske baad aap apne laptop se ADB (Android Debug Bridge) ke through phone mein commands likh sakte hain. Jaise:

```
adb shell
```

```
adb install app.apk
```

Root karna:

Android phone ko root karna possible hai. Root ka matlab hai phone ka full control lena – jaise PC mein administrator ban jaate hain. Root karne ke tools hain: Magisk, SuperSU, Kingroot.

### Tutorials:

Internet par jo bhi mobile hacking tutorials hain, unme se 90% sirf Android ke liye hote hain. Kyunki Android open hai, isliye uspar practice karna aasan hai.

Conclusion for Android: Agar aap hacking seekhna chahte hain to Android best hai.

### iOS – Band Darwaza (Closed Gate)

iPhone ka system completely closed hai. Apple chahta hai ke user system files mein bilkul bhi interfere na kare.

iOS mein kya kya ho sakta hai (bina jailbreak ke)?

**Apps install karna:**

Aap sirf App Store se hi apps install kar sakte ho. Koi bhi third-party app ya unknown source se install nahi kar sakte.

**System files:**

Aap system files ko dekh nahi sakte, modify to bilkul nahi kar sakte. Apple ne sab kuch lock kar rakha hai.

**Jailbreak:**

Agar aap iOS mein koi bhi hacking-related karna chahte ho to pehle jailbreak karna hoga. Jailbreak ka matlab hai Apple ke band darwaze ko todna.

Naye iPhones (iPhone 11, 12, 13, 14, 15) mein jailbreak bohot mushkil hai.

Purane iPhones (iPhone X aur usse purane) mein Checkra1n tool se jailbreak ho sakta hai.

**Jailbreak ke baad kya hoga?**

Jailbreak ke baad iPhone bhi Android jaisa ho jaata hai. Aap Cydia (jailbreak apps ka store) se tweaks install kar sakte ho, SSH access le sakte ho, file system modify kar sakte ho.

Conclusion for iOS: Bina jailbreak ke iOS par kuch bhi hacking-related almost impossible hai. Jailbreak ke baad sab possible hai, lekin jailbreak karna aaj kal bohot mushkil hai.

Quick Comparison (Simple Words Mein)

**Android:**

Apps install from anywhere – easy

Root available – medium to hard depending on brand

ADB works fully – even without root

Best for learning mobile hacking

**iOS (Without Jailbreak):**

Apps only from App Store

No system access

Almost nothing possible for hacking

Best for personal security, not for hacking

iOS (With Jailbreak):

Same power as Android

Cydia tweaks, SSH access, file system modify

Only possible on older iPhones (iPhone X and below)

Toh humein kya karna chahiye?

### **Agar aap hacking seekhna chahte hain:**

Le lo koi purana Android phone. Jaise Samsung Galaxy S8/S9, Xiaomi Redmi Note series, ya Google Pixel 2/3. Koi bhi phone jiska bootloader unlock ho sakta ho.

Pehle us phone ko root karo. Root karne ke baad phone ka full control tumhare haath mein aa jayega.

Phir maza aayega. Tum Metasploit, NetHunter, Frida, Termux sab kuch use kar sakte ho.

Agar tumhare paas iPhone hai aur tum wahi use karna chahte ho:

Toh koi purana iPhone (iPhone 6, 7, 8, X) le lo aur Checkra1n se jailbreak kar lo. Jailbreak ke baad iOS bhi Android ki tarah hackable ho jata hai.

### **Practical Task for Students**

#### **Task 1 – Android Users:**

Apne Android phone mein yeh karo:

Jaao Settings mein.

Scroll down karo to About Phone.

Build Number par 7 baar tap karo.

Ab Developer Options on ho jayega.

Wahan se USB Debugging on karo.

Ab laptop mein ADB install karo aur command likho: adb devices

Dekho – tumhara phone detect ho raha hai ya nahi.

#### **Task 2 – iPhone Users (without jailbreak):**

Bina jailbreak ke tum kuch nahi kar sakte. Pehle jailbreak karo (old iPhone required) phir similar commands seekhna.

Note for iPhone users: Yeh task tumhare liye impossible hai (hahaha) jab tak jailbreak nahi karte.
