

# Mobile Hacking Basics

Only for study do not try on another phone  
Made by Syed Ghous

## Mobile vs PC Hacking | What's the Difference?

Jab hum PC hacking aur mobile hacking ki baat karte hain, to sabse pehla farq ye hai:

PC mein aapko administrator (root) access pehle se milta hai.  
Mobile mein aapko root access khud se lena padta hai.

Iska matlab kya hai?

PC (Windows / Linux / Mac):

Jaise hi aap apna computer on karte ho, aapke paas system ki har file tak access hoti hai. Aap koi bhi software install kar sakte ho, koi bhi file delete kar sakte ho, system settings badal sakte ho.

Kisi bhi hacking tool ko chalane ke liye extra permission nahi leni padti.

Linux mein sudo command se aap root ban jaate ho. Windows mein administrator account sab kuch kar sakta hai.

Mobile (Android / iOS):

Mobile mein default user ko system files tak access nahi di jaati.

Agar aap bina root ke Android ke System folder mein jaana chaho to wahan kuch bhi dikhta nahi – access denied.

iPhone mein to aur bhi strict hai – bina jailbreak ke kuch bhi nahi kar sakte.

Mobile ke har app ko ek alag sandbox (bounded area) milta hai – ek app doosre app ka data nahi dekh sakti.

Ek simple example se samjhein:

PC par aap C: drive mein Windows folder mein jaake koi file delete kar sakte ho (galati se bhi).

Mobile par bina root ke aap sirf apne photos, messages, apps tak hi limited rahte ho. System files ko haath nahi laga sakte.

Toh pehla difference ye hai:

### PC Hacking

Administrator access default hai  
System par full control pehle se  
Tools install karna aasan

### Mobile Hacking

Root / Jailbreak khud karna padta hai  
Control lene ke liye pehle darwaza todna padta hai  
Tools chalane ke liye extra permissions chahiye

PC hacking foran shuru kar sakte ho – bas apna computer le lo aur tools install karo.

Mobile hacking ke liye pehle apna phone root karna hoga (ya phir koi purana phone le jiska bootloader unlock ho).

Isliye beginners ko pehle PC hacking seekhne ki salah di jaati hai, phir mobile ki taraf aana chahiye.

Isi baat se andaza laga lein ke:

1. Apne Android phone mein Developer Options on karein.
2. USB Debugging enable karein.
3. Laptop se ADB connect karein aur likhein: `adb shell`
4. Phir `ls` likh kar dekhein – aapko system files dikhengi lekin unme se kuch modify nahi kar sakte bina root ke.

Is tarah aap khud dekh sakte hain ki mobile par access kitna limited hai.

## **Android vs iOS – What's Possible?**

Yeh sabse pehla sawaal hai jo har beginner poochta hai:  
Android hack karna easy hai ya iPhone?

Lesssgooooooooo samgthy hein isy

## **Android – Open Gate**

Android ka system Linux par based hai. Matlab thoda sa khula hua hai.  
hum easily apps install kar sakta hai outside Play Store.  
USB debugging on karke ADB se direct phone me command maar sakta hai.  
Root karna bhi possible hai (Magisk, SuperSU).

Isliye 90% mobile hacking tutorials Android ke liye hi hote hain.

## **iOS – Band Darwaza**

iPhone ka system completely closed hai.  
Apple nahi chahta ke hum system files me ghuse.  
Apps sirf App Store se aati hain (unless hum jailbreak kare).  
Jailbreak karna bhi mushkil ho raha hai naye iPhones me.

Haan agar hum koi purana iPhone le (iPhone X ya older) to Checkra1n se jailbreak ho sakta hai.  
Jailbreak ke baad iOS bhi Android jaisa ho jata hai – Cydia tweaks, SSH access, file system modify sab kuch.

## **Quick Comparison (Simple Words Mein)**

**Android:**

Apps install from anywhere – easy

Root available – medium to hard depending on brand

ADB works fully – even without root

Best for learning mobile hacking

## **iOS:**

Without jailbreak – almost nothing possible

With jailbreak – same power as Android

Jailbreak now rare for new models

Best for personal security, not for hacking practice

## **Toh hamyen kya karna chahiye?**

Agar hum hacking seekhna chahta hai – koi purana Android phone.  
Samsung, Xiaomi, ya Pixel – jiska bootloader unlock ho sake.  
Phir usko root karo.

## **Practical Task for Student**

**Task 1:** Jao apne Android phone me Settings > About Phone > Build Number par 7 baar tap karo. Developer Options on ho jayega. Phir wahan se USB Debugging on karo.

**Task 2:** Laptop me ADB install karo. Command likho: adb devices. Dekho phone detect ho raha hai ya nahi.

Yahi task iPhone walo ke liye impossible hai hahaha (without jailbreak).

## **PC aur mobile hacking mein doosra farq – "Attack Vector"**

PC hacking: aksar network se hota hai (remote access, phishing email, infected USB)

**Mobile hacking:** zyada tar user ko click karwana padta hai (install APK, enable permissions, QR code scan)

Isliye mobile hacking mein "social engineering" zyada important hai.

## **2. Mobile hacking ke liye emulator ka option**

Agar kisi ke paas doosra phone nahi hai to woh Android emulator (BlueStacks, Genymotion, Android Studio) use kar sakta hai apne PC par.

Emulator mein root access pehle se milta hai.

## **3. Root ke faide thoda detail mein**

Uper ye likha "root karna possible hai" – lekin ye bhi bata do:

Root ke baad aap \*system apps hata sakte ho, custom ROM laga sakte ho, full backup kar sakte ho, hacking tools (NetHunter) install kar sakte ho.

: "Root ke baad mobile PC jaisa ho jaata hai – full control"

## **4. iOS ke liye jailbreak alternatives (thoda advanced)**

Aaj kal naye iPhones (iOS 15-17) par jailbreak mushkil hai, lekin side-loading ke zariye bina jailbreak ke bhi kuch apps install ho sakti hain (AltStore, Sideloadly).

Yeh option unke liye hai jo sirf iOS seekhna chahte hain.
